A barn (symbol: b) is a unit of area equal to  $10^{-28} \text{ m}^2$  (or  $100 \text{ fm}^2$ ). Originally used in nuclear physics for expressing the cross sectional area of nuclei and nuclear reactions, today it is also used in all fields of high-energy physics to express the cross sections of any scattering process, and is best understood as a measure of the probability of interaction between small particles.

We study geometric properties of GL-spaces. We demonstrate that every finite-dimensional GL-space is polyhedral; that in dimension 2 there are only two, up to isometry, GL-spaces, namely the space whose unit sphere is a square (like  $\mathbb{R}^2$  or  $\mathbb{C}^1$ ) and the space whose unit sphere is an equilateral hexagon.
