

### **self adjoint extensions in pdf**

In mathematics, a self-adjoint operator on a finite-dimensional complex vector space  $V$  with inner product  $\langle \cdot, \cdot \rangle$  is a linear map  $A$  (from  $V$  to itself) that is its own adjoint:  $\langle Av, w \rangle = \langle v, Aw \rangle$ , for all vectors  $v$  and  $w$ . If  $V$  is finite-dimensional with a given orthonormal basis, this is equivalent to the condition that the matrix of  $A$  is Hermitian, i.e., equal to its conjugate transpose  $A^*$ .

In mathematics, specifically in harmonic analysis and the theory of topological groups, Pontryagin duality explains the general properties of the Fourier transform on locally compact abelian groups, such as  $\mathbb{Z}$ , the circle, or finite cyclic groups. The Pontryagin duality theorem itself states that locally compact abelian groups identify naturally with their bidual.

Stieltjes, Perron, and Markov in analysis of the moment problem, for absolutely continuous measures, constructed the underlying measure as the discontinuity across the cut of a Cauchy representation of an otherwise real-analytic function.
